

SHOPSY E-COMMERCE DATABASE MANGEMENT SYSTEM

ORDER AND ORDER_ITEM MANAGEMENT SYSTEM

INTRODUCTION :

The Orders and Order_Details tables are used to manage customer orders in a database system. The Orders table stores basic information such as order ID, customer ID, order date, order status, and total amount. The Order_Details table stores the products included in each order, along with their quantity and unit price. These tables help to maintain order information accurately and make it easy to insert, modify, and retrieve customer order history.

Conclusion :

The Order Management System was successfully designed using the Orders and Order_Item tables. The tables store important order information such as customer details, order date, order status, total amount, product, quantity, and unit price. Primary and foreign key relationships were used to maintain data integrity between Customer, Orders, Product, and Order_Item tables. Order records were inserted and modified using SQL commands. Customer order history and customer-wise order summaries were also generated to manage and analyze order information effectively.
